POLLUTION CAN KILL FISH AND OTHER AQUATIC LIFE AND ALSO AFFECT BIODIVERSITY, AMENITY VALUE AND THE USE OF WATER AND LAND FOR AGRICULTURAL PURPOSES.

If you've spotted signs of pollution in rivers or streams, we'd really like you to let us know so we can act right away.

The most obvious sign of sewage pollution of a stream or river is the presence of sewage solids in the water, but there maybe other indications. These include:

- toilet debris such as toilet paper, condoms and sanitary products
- soap suds or a milky-looking discharge in the water
- grey coloured water
- a noticeable sewage smell in the outside air
